THE STINGER BS120PROG SOFTWARE MANAGEMENT SYSTEM

1. GENERAL

The "Stinger™" software is a Microsoft based software package which is dedicated for use with the Stinger™ systems. This package has been designed with user friendliness in mind and is currently widely used where multiple BS120 energizers and CDS units are implemented for the protection of high security premises, such as residential security estates, industrial sites, power plants, government buildings and most national key points.

The system has been specifically designed to provide total control over security guards with respect to the duty they have to perform.

Up to 127 BS120 units can be controlled by this program. Each of these units can control a different site and each site will have its own sitemap on which the software will indicate the relevant information in the event of an alarm.

The program provides the user with all information, which is required to monitor and manage the entire perimeter security system.

A logfile is automatically created to provide history information with time and date stamp. A printout of this file can be retrieved any time or automatically at the end of each day.

The Stinger software features extensive protection which will prevent tampering with the software by the guards on duty.

An additional feature of the program is the ability to automatically send a text message to multiple users in the event of an alarm condition. The text message will contain the name of the site, the type of alarm as well as the zone in which the alarm occurred.
